1 Propositional Logic

Basic Logical Equivalences

Commutative Law

- $p \wedge q \equiv q \wedge p$
- $p \vee q \equiv q \vee p$

Associative Law

- $(p \wedge q) \wedge r \equiv p \wedge (q \wedge r)$
- $(p \vee q) \vee r \equiv p \vee (q \vee r)$

Distributive Law

- $p \wedge (q \vee r) \equiv (p \wedge q) \vee (p \wedge r)$
- $p \vee (q \wedge r) \equiv (p \vee q) \wedge (p \vee r)$

Identity Law

- $p \wedge \mathbf{t} \equiv p$
- $p \vee \mathbf{c} \equiv p$

Negation Law

- $p \vee \sim p \equiv \mathbf{t}$
- $p \wedge \sim p \equiv \mathbf{c}$

Double Negation Law

- $\sim(\sim p) \equiv p$

Idempotent Law

- $p \wedge p \equiv p$
- $p \vee p \equiv p$

Universal Bound Law

- $p \vee \mathbf{t} \equiv \mathbf{t}$
- $p \wedge \mathbf{c} \equiv \mathbf{c}$

De Morgan's Law

- $\sim(p \wedge q) \equiv \sim p \vee \sim q$
- $\sim(p \vee q) \equiv \sim p \wedge \sim q$

Absorption Law

- $p \vee (p \wedge q) \equiv p$
- $p \wedge (p \vee q) \equiv p$

Negations of $\mathbf{t}$ and $\mathbf{c}$

- $\sim \mathbf{t} \equiv \mathbf{c}$
- $\sim \mathbf{c} \equiv \mathbf{t}$

XOR

- $p \oplus q \equiv (p \vee q) \wedge \sim(p \wedge q)$
- $p \oplus q \equiv (a \wedge \sim b) \vee (\sim a \wedge b)$

Implication (If-Then)

- $p \rightarrow q \equiv \sim p \vee q$

Equivalence (Biconditional If and Only if)

- $p \leftrightarrow q \equiv (p \rightarrow q) \wedge (q \rightarrow p)$

2 Digital Logic Circuits

Disjunctive Normal Form (DNF)

“OR of ANDs”

From truth table to DNF

1. Identify the rows whose output is 1
2. AND together all variables in the same row (negate the variable when 0)
3. OR together the 1-rows

Conjunctive Normal Form (CNF)

“AND of ORs”

From truth table to CNF

1. Identify the rows whose output is 0
2. OR together all variables in the same row (negate the variable when 1)
3. AND together the 0-rows

NOR Gate

NOT Using NOR

OR Using NOR

AND Using NOR

NAND Gate

NOT Using NAND

OR Using NAND

AND Using NAND

2. **Inductive Hypothesis:** Assume $P(k)$ true for any $k \geq b$
3. **Inductive Step:** Show that $P(k) \rightarrow P(k+1)$ is true
4. **Conclusion:** If $P(b)$ is true and $P(k) \rightarrow P(k+1)$ is true, conclude that $P(n)$ is true for all $n \geq b$

Proof by Strong Mathematical Induction

- Prove recursive problems with several base cases (e.g., recurrence relations with order larger than 1)
- Makes a stronger hypothesis than the principle of Mathematical Induction:
 - The **base step** may contain proofs for **several initial values**, rather than just the base case
 - In the inductive step, the trust of $P(k)$ is assumed not just for an arbitrary $k \geq b$ but for **all values through k**

Let b, b be two integers with $a \leq b$. To prove that a property $P(n)$ is **true** for every integer $n \geq a$:

1. **Base Case:** Show that $P(n)$ is true for all base cases from a to b , that is: $P(a) \wedge P(a+1) \wedge \dots \wedge P(b)$
2. **Inductive Hypothesis:** For any $k \geq b$, assume $P(i)$ is true for $i = a, \dots, b, \dots, k$
3. **Show** that $P(k+1)$ is true
4. **Conclusion:** If 1 and 2 are verified, conclude that $P(n)$ is true for all $n \geq a$

3 Induction and Recursion

Proof by Mathematical Induction

To prove that a property $P(n)$ is **true** for every integer $n \geq b$:

1. **Base Case:** Show that $P(b)$ is true

Method of the Loop Invariant to Prove Algorithm Correctness

For every $n \geq 0$, let $P(n)$ be the loop invariant for a loop. **If the following four properties are true, then the loop is correct** with respect to its pre- and post-conditions:

1. **Basic property:** the loop invariant is true before the loop starts, i.e., $P(0)$ is true before the loop starts. ($P(0)$ is $P(n)$ when $n = 0$). $\rightarrow$ “The loop invariant is true before the loop starts (i.e., base case is true)”
2. **Inductive property:** for any integer $k \geq 0$, if **both the guard G and the loop invariant $P(k)$** are true before an iteration of the loop, then $P(k + 1)$ is true after iteration. $\rightarrow$ “It remains true after every iteration (i.e., $P(k) \rightarrow P(k + 1)$)”
3. **Eventual Falsity of the Guard:** after a finite number of iterations of the loop, the guard G becomes false. $\rightarrow$ “The loop eventually stops (i.e., that the loop condition eventually turns false)”
4. **Correctness of the post-condition:** if N is the number of iterations after which G is false and $P(n)$ is true, then the post-condition is satisfied. $\rightarrow$ “At the point when the loop ends, you need to verify that the **loop invariant** is true”

4 Functions and Convolution

Laws of Exponents

- $b^u b^v = b^{u+v}$
- $(b^u)^v = b^{uv}$
- $\frac{b^u}{b^v} = b^{u-v}$
- $(bc)^u = b^u c^u$
